

HBCD ERICA Coding Data: Instructions for Creating an Integrated Analytic Data Set for Data Release 2.1

Please note: it is critical that these instructions are followed correctly to create an integrated analytic data set **prior to analysis**. The integrated analytic data set combines the reliability codes (for n=171 videos that were double coded) with the original codes (for n=863 videos that were not double coded). As is traditional with observational data, the reliability codes are treated as final data and therefore supersede the original codes for the n=171 that were double coded. **Failure to follow these instructions correctly will result in incorrect data analysis. These steps will ONLY be done for data release 2.1.**

	Task	Final n
Step 1	Open the ERICA primary coding data file. (mh_cg_erica_3_9m). This is your primary data file. All removals and additions will be made to this file to create a final integrated analytic data set.	n=1,078
Step 2	Remove n=44 participants flagged for exclusion due to data errors in the “ ERICA_2.1_DataError_EXCLUSIONS ” .csv file, which can be accessed via links from the README. 1. Be sure to remove the entire data record (participant and codes). 2. Once removed, you will have n=1,034 records in your primary coding data file.	n=1,034
Step 3	Remove n=171 participants whose subject IDs are listed in the “ ERICA_2.1_Analytic_REMOVALS ” .csv file, which can be accessed via links from the README. 1. Be sure to remove the entire data record (participant and codes). 2. Once removed, you will have n=863 records in your primary coding data file.	n=863
Step 4	Add n=171 participant records (including all data) from the reliability codes (mh_cg_erica_rel_3_9m) to your primary coding data file. These are the reliability codes that will replace the original codes removed in Step 3. 1. Open the reliability codes file (mh_cg_erica_rel_3_9m) 2. Select the participant records for the n=171 participants you removed in Step 3 (IDs listed in “ ERICA_2.1_Analytic_REMOVALS ”) 3. Copy/paste or merge the n=171 data records from reliability codes into your primary coding data file. 4. Be sure to copy the entire record (participant and codes). Ignore all other records in the reliability codes—you will not use the reliability codes for any other purpose. 5. This creates your final integrated analytic data set (n=1,034).	n=1,034
Step 5	Correct the code value for n=3 participants for whom the value for child irritability (mh_cg_erica_3_9m_b_raw code) is > 3.0 (i.e., 3.2 or 3.4). 1. For the n=3 participants with raw code values > 3.0, change the value to 3.0 prior to analysis. 2. See “Known Issues” for further detail.	
Step 6	Delete the “Locomotor Ability” field (mh_cg_erica_3_9m_locomotor_ability) from the data set as this data has errors and should not be used in analysis. 1. You may simply delete the entire column for “ mh_cg_erica_3_9m_locomotor_ability .”	
Step 7	Check that your final integrated analytic data set was constructed correctly. If done correctly, you should have: 1. n=956 records with valid data for all 7 codes 2. n=78 records with missing data for all 7 codes. 3. The following means for these codes: a. Child Positive Affect (mh_cg_erica_3_9m_a_raw): Mean=1.84 (n=956) b. Connectedness (mh_cg_erica_3_9m_g_raw): Mean=1.89 (n=956)	
Step 8	Save your analytic data file! You are all ready to conduct analyses of the ERICA coding data! Please include in any publication a sentence confirming that the ERICA data was analyzed using the “ integrated analytic data set from HBCD Data Release 2.1 ”.
